

Git workflow for the team

The brief asks for feature branches merged into `main` through Pull Requests. Here's a simple routine that satisfies that and keeps us out of each other's way.

One-time setup

```
git init
git add .
git commit -m "Initial project skeleton"
git branch -M main
git remote add origin https://github.com/<your-org>/employee-dw.git
git push -u origin main
```

Suggested branches (one per teammate or deliverable)

Branch	What goes in it
feature/data-synthesizer	scripts/synthesize_data.py , scripts/load_staging.py
feature/database-design	sql/01 - 03 and the diagrams in docs/diagrams/
feature/etl-procedures	sql/04 , sql/05 , scripts/run_etl.py
feature/oop-backend	everything in src/
feature/streamlit-dashboard	everything in app/
docs/readme-and-report	README, docs/ , the Google doc

Day-to-day

```
git checkout main && git pull
git checkout -b feature/streamlit-dashboard
# ...work, then...
git add app/
git commit -m "Add attrition risk tab to the dashboard"
git push -u origin feature/streamlit-dashboard
```

Open a Pull Request on GitHub, ask a teammate to review it, and merge it into `main` when it's approved. Don't push straight to `main`. After merging, everyone runs `git pull` on `main` before starting new work.

Tips

- Small commits with plain-English messages are easier to review than one giant one.
- Never commit `.env` or `.streamlit/secrets.toml` (they're in `.gitignore`).

- If two people touched the same file, resolve the conflict locally, run `python scripts/smoke_test.py` , then push.
